Actoe="Hypothetical arginine-rich gene product;" Hypothetical CDS constructed from overlapping ESTs and Xgrall predictions. EST coverage is lacking for some portions of the CDS. Gene may be alternatively spliced, as multiple transcripts map into this region; alternatively these individual clones may represent artifactual events during RT and CDNA creation"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note="predicted exon, program: grail2exons_human_1.3,

```
the tag7 DNA sequence are used to express recombinant tag7. Tag7 is used especially for treating carcinoma (of liver, ovary, breast, cervix, lung, prostate, colon/rectum, bladder, testis, stomach, pancreas, mouth, head overce or fibro-sarcomas), melanoma or leukaemia; and as a molecular apoptosis. The tag7 Dolypeptide inhibits tumour growth and induces mapping and detection of tag7 gene expression, and as probes for gene against tag7 are used as reagents for detecting tag7; as an antagonist of tag7; for isolating tag7 and therapeutically to inhibit or delay tumour from the tag7 coding sequences are also useful as probes for gene against tag7; for isolating tag7 and therapeutically to inhibit or delay tumour from the tag7 coding sequences.
                                                         This sequence encodes the murine tag? of the invention.
the tag? DNA sequence are used to express recombinant ta

This cDNA sequence encodes the precursor (see AAW23723) of a novel, claimed antimicrobial peptide from bovine neutrophils, designated murine granulocyte peptide A or MGP-A (see AAW3725). It was solvine BGP-A cDNA (see AAW3725). It was solvine BGP-A cDNA (see AAW3725). It was comprises signal peptide A or MGP-A (see AAW3725). It was comprises signal peptide and propeptide sequences followed by 12 C-terminal amino acids corresponding to mature MGP-A and Gram-negative bacteria, fungi and viruses, specifically Gram-positive and Stam-negative bacteria, fungi and viruses, specifically Staphylococcus arreus, Eschrichia coli, Candida albicans, used in human or veterinary medicine (particularly to treat disorders associated with lipopolysaccharides, e.g. sepsis and supplies (claimed). They can a preservatives in food products or in water supplies (claimed). They can also be applied to crops to reduce
